

# From old to new

Companies often have applications and hardware interfaces that have stood the test of time. They have worked continuously for years, and as client systems have been updated, they have not. These applications and hardware interfaces often times become incompatible with new technology that your employees use, making it hard on staff to deal with two different systems.

Here at The Geneva Group, we can give you the best of both worlds. From converting your old application to make it compatible with today's systems, to writing new device drivers to make sure your hardware keeps working, The Geneva Group can make the old new again.

We've completed many projects that have made the old new again, such as:

- Migration of older applications to new platforms
- Device driver development for hardware
- Consolidation of existing applications into one application
- Convert and transfer data from one application to another.
- Upgraded, enhanced and added features to existing applications
- Custom programming design for "lost vendor" applications

The Geneva Group can help your business keep critical older systems and hardware working in harmony with new systems. Why lose time and money when you can have the old made new again? Call us today!
